

Stages	Start	Progress	Progress	End
Thinking	"I need to buy some fresh farm produce. I hope this app can provide good options."	"I found the products I like, but are these the best deals?"	"I'm almost done, but I need to check my cart one last time to make sure everything is correct."	"I'm happy with the items I bought, but I hope they arrive fresh."
Doing	"I wonder if the app will have the fruits and vegetables I want."	Clicking on products to view more details, such as prices and reviews	Reviewing the cart to ensure everything is correct.	Reviewing the purchase history and considering leaving feedback.
Pain Points	I need to check the prices, but there are so many products. It feels overwhelming	The app is offering many products, but I'm not sure if I'll find everything I need here	I'm anxious about delivery charges and the total cost	There's no way to track the status of my order after checkout.
Opportunities / Solution	Include clearer descriptions of product quality (e.g. "freshly harvested," "organic").	Offer deals or bundles (e.g., discounts for buying certain combinations of products).	Add a clear breakdown of delivery fees upfront so users aren't surprised later.	Add a clear breakdown of delivery fees upfront so users aren't surprised later.

# Brainstorm

## Context

- Farmers need timely updates about pest outbreaks, weather changes, and crop health.
- Users have different phone usage habits (smartphone / basic phone).
- Notifications must be helpful, not disturbing, especially during work hours.
- Alerts should support quick decision-making to prevent crop loss.
- Why are we meeting today?
  - To design a notification system that keeps farmers informed without overwhelming them.
  - To understand how and when farmers need to receive alerts.
  - To explore multiple notification channels suitable for rural users.
- What are the shared user goals?
  - Receive important alerts on time.
  - Avoid unnecessary or repeated notifications.
  - Easily understand the urgency and action required.
  - Stay productive in the field without distraction.

Farmers need quick updates

- Time-sensitive information
- Minimal reading required
- Immediate action focus

Weather changes affect crops

- Sudden damage risk
- Crop-specific impact
- Preventive actions needed

Pest attacks need fast action

- Early detection is critical
- Rapid spread possible
- Immediate treatment required

## To come away with today...

- Some sense of what we're trying to accomplish
  - Identify the best notification types (push, SMS, in-app).
  - Define urgency levels for alerts (low, medium, critical).
  - Ensure notifications support fast action and reduce crop damage.
- A shortlist of ideas to move forward with
  - Priority-based alerts (critical vs informational).
  - Customizable notification settings.
  - Simple language and visual indicators.
  - Multi-channel notification delivery.

Clear alert priorities

- Critical vs non-critical
- Visual urgency cues
- Reduce alert overload

Best notification channels

- SMS for reliability
- App alerts for details
- Multi-channel delivery

Simple message formats

- Short and direct
- Easy to understand
- Action-oriented

## Guidelines

- Notifications must be:
  - Easy to understand (icons, colors, local language).
  - Customizable by the farmer.
  - Non-intrusive and respectful of work hours.
- Critical alerts should override silence mode if enabled by the user.
- Keep messages short and action-oriented.

Short and clear messages

- One key message
- Quick to scan
- No extra details

Use local language

- Better comprehension
- Builds trust
- Reduces mistakes

Farmers need quick updates

- Speed over detail
- Reliable delivery
- Supports daily decisions

## Other context

- Many farmers may have low internet connectivity.
- SMS alerts are important for non-smartphone users.
- Seasonal farming activities affect notification timing.
- Feedback from farmers will be collected via surveys and usability testing.

Poor internet connectivity

- Works offline/low data
- SMS supported
- Lightweight content

Seasonal farming needs

- Season-specific alerts
- Relevant timing
- Avoid off-season noise

Different crop types

- Crop-specific risks
- Customized alerts
- Higher relevance
